

the 1990s, the number of people in the world who are under 15 years of age has increased from 1.1 billion to 1.5 billion, and the number of people aged 65 and over has increased from 0.2 billion to 0.5 billion (United Nations, 1999).

There are a number of reasons why the world population is ageing. First, the number of people who are aged 65 and over has increased because of the increase in life expectancy. Second, the number of people who are aged 65 and over has increased because of the increase in the number of people who are aged 65 and over who are still alive. Third, the number of people who are aged 65 and over has increased because of the increase in the number of people who are aged 65 and over who are still alive.

The increase in the number of people who are aged 65 and over has a number of implications for the world. First, it means that there are more people who are aged 65 and over who are still alive. Second, it means that there are more people who are aged 65 and over who are still alive. Third, it means that there are more people who are aged 65 and over who are still alive.

Second, it means that there are more people who are aged 65 and over who are still alive. Third, it means that there are more people who are aged 65 and over who are still alive.

the 1990s, the number of people in the world who are under 15 years of age has increased by 1.2 billion, from 1.1 billion in 1980 to 2.3 billion in 1999. The number of people aged 15 years and over has increased by 1.1 billion, from 1.1 billion in 1980 to 2.2 billion in 1999.

There are a number of reasons why the world population is growing so rapidly. One of the main reasons is that the number of children born to each woman has increased. In 1980, the average woman in the world had 2.5 children. In 1999, the average woman in the world had 2.7 children. This is a small increase, but it is enough to make a big difference over time.

Another reason why the world population is growing so rapidly is that the number of people who are living longer is increasing. In 1980, the average person in the world lived for 60 years. In 1999, the average person in the world lived for 65 years. This is a small increase, but it is enough to make a big difference over time.

There are a number of other reasons why the world population is growing so rapidly. One of the main reasons is that the number of people who are moving from rural areas to cities is increasing. In 1980, there were 1.1 billion people in the world who were living in cities. In 1999, there were 2.2 billion people in the world who were living in cities. This is a big increase, and it is one of the main reasons why the world population is growing so rapidly.

There are a number of other reasons why the world population is growing so rapidly. One of the main reasons is that the number of people who are moving from developing countries to developed countries is increasing. In 1980, there were 1.1 billion people in the world who were moving from developing countries to developed countries. In 1999, there were 2.2 billion people in the world who were moving from developing countries to developed countries. This is a big increase, and it is one of the main reasons why the world population is growing so rapidly.
